INTRODUCTION

PROJECT TITLE:

Fruit Inventory Management System

LANGUAGE: C#.Net

DATABASE: SQL

SOFTWARE'S: Visual studio 2022, Microsoft SQL Server Management Studio 2018

DEVELOPMENT TOOL AND TECHNOLOGY USED: The Fruit Inventory Management System is a desktop-based Windows application developed using the C# programming language within the Microsoft .NET framework. The system utilizes a Microsoft SQL Database for efficient data management.

OBJECTIVE:

- Efficiency
 - Effectiveness
 - Design for Management
-

COMPANY OVERVIEW

Name of the Company: DNJ Fruit Merchant and Commission Agent

Owner: Dashrath Namdev Jadhav

Date of Establishment: 1980

Address: Vashi, Navi Mumbai

DNJ Fruit Merchant and Commission Agent is a business located at A.P.M.C Fruit Market, Vashi, Navi Mumbai. DNJ Fruit Merchant and Commission Agent operates as a middle agent, purchasing fruits from suppliers and selling them to customers.

CURRENT SYSTEM AND LIMITATIONS

CURRENT SYSTEM : The existing system relies on manual procedures, where all records, including customer details, supplier details, order details, and product records, are stored manually in file registers. The maintenance of records over an extended period becomes challenging. The current process for the agent involves lengthy and tedious manual record-keeping. Retrieving specific records when required poses difficulties, creating obstacles for business partners who need access to the records. Locating particular records and tracking sales manually is a time-consuming task.

LIMITATIONS:

- The manual maintenance of details in registers is labour-intensive and time-consuming.
 - Entry and record-checking processes are time-consuming when done manually.
 - Modifying the records is not very easy since for a minute change all the records would be required to be re-entered
-

PROPOSED SYSTEM AND ADVANTAGES

PROPOSED SYSTEM: Our project aims to streamline and modernize the current manual processes of DNJ Fruit Merchant and Commission Agent through the implementation of a Fruit Inventory Management System. This system will leverage technology to automate various tasks and improve overall efficiency. Our proposed system is simple and without complexity at the same time SQL server provides the features such as primary key, foreign key. Visual Basic is used as a Front end which will provide a strong graphic user interface along with a user-friendly environment.

ADVANTAGES :

- CENTRALIZED DATABASE
 - REPORTS GENERATION
 - SECURITY MEASURES
 - PRINTING
-

DATA DICTIONARY

Project Name: Fruit Inventory Management System

1.Table Name: registration_details

It store the registration details.

Sr.no	Field Name	Expansion Name	Field Type	Null/Not Null	Description
1	name	name	varchar(50)	not null	It will store the name of the user.
2	user name	user name	varchar(50)	not null	It will store the user name.
3	password	password	varchar(50)	not null	It will store the password.

2.Table Name: supplier_order

It store the supplier order

Sr.no	Field Name	Expansion Name	Field Type	Null/Not Null	Description
1	s_o_id	supplier order id	int	not null	It is a primary key and used to store the supplier order id. It will auto generate.
2	s_id	supplier id	int	not null	It is used to store supplier id.
3	date	date	date	not null	It is used to store the date.
4	total	total	int	not null	It is used to store the total amount of supplier order.

3.Table Name: supplier_personal_details

It store the supplier’s personal details.

Sr.no	Field Name	Expansion Name	Field Type	Null/Not Null	Description
1	s_id	supplier id	int	not null	It is a primary key and used to store the supplier’s id. It will auto generate.
2	s_name	supplier name	varchar(50)	not null	It is used to store the supplier’s name.
3	state	state	varchar(50)	not null	It is used to store the supplier’s state.
4	city	city	varchar(50)	not null	It is used to store the supplier’s city.
5	district	district	varchar(50)	null	It is used to store the supplier’s district
6	address	address	varchar(100)	null	It is used to store the supplier’s address.
7	contact	contact	nchar (10)	not null	It is used to store the supplier’s contact number.

4.Table Name: supplier_order_details

It store the supplier order details.

Sr.no	Field Name	Expansion Name	Field Type	Null/Not Null	Description
1	o_id	order id	int	not null	It is used to store order id. It will auto generate.
2	s_name	supplier name	varchar(50)	not null	It is used to store name of supplier.
3	f_name	fruit name	varchar(50)	not null	It is used to store the fruits name.
4	variety	variety	varchar (50)	not null	It is used to store the fruits variety
5	quant	quantity	int	not null	It is used to store the quantity of a fruit.
6	unit	unit	varchar(10)	not null	It is used to store the unit of fruit
7	price	price	int	not null	It is used to store the Price of fruit.

5.Table Name: customer_order
It store the customer's order .

Sr.no	Field Name	Expansion Name	Field Type	Null/Not Null	Description
1	c_o_id	customer order id	int	not null	It is used to store the customer order id. It will auto generate.
2	c_id	customer id	int	not null	It is used to store the customer id.
3	date	date	date	not null	It is used to store the date.
4	total	total	int	not null	It is used to store the total amount of customer order.

6.Table Name: customer_personal_details
It store the customer's personal detalis

Sr.no	Field Name	Expansion Name	Field Type	Null/Not Null	Description
1	c_id	customer id	int	not null	It is a primary key and it is used to store customer's id. It will auto generate.
2	c_name	customer name	varchar(50)	not null	It is used to store customer name.
3	state	state	varchar(50)	not null	It is used to store the customer's state
4	city	city	varchar(50)	not null	It is used to store the customer's city
5	district	district	varchar(50)	null	It is used to store the customer's destriect.
6	address	address	varchar(100)	null	It is used to store the customer's address
7	contact	contact	nchar (10)	not null	It is used to store the customer's contact number

7.Table Name: customer_order_details

It store the customer’s order detail.

Sr.no	Field Name	Expansion Name	Field Type	Null/Not null	Description
1	o_id	order id	int	not null	It is used to store order id. It will auto generate
2	c_name	customer name	varchar(50)	not null	It is used to store name of customer.
3	f_name	fruit name	varchar(50)	not null	It is used to store fruit name.
4	variety	variety	varchar(50)	not null	It is used to store the variety of a fruit
5	quant	quantity	int	not null	It is used to store a quantity of a fruit.
6	unit	unit	varchar(50)	not null	It is used to store the unit of fruit.
7	price	price	int	not null	It is used to store the price of fruit.

8.Table Name: supplier_payment_details

It store the payment details of supplier.

Sr.no	Field Name	Expansion Name	Field Type	Null/Not Null	Description
1	p_id	payment id	int	not null	It is used to store payment id. it will auto generate.
2	s_name	supplier name	varchar(50)	not null	It is used to store supplier name
3	date	date	int	not null	It is used to store date of transaction
4	amount	amount	int	not null	It will store amount paying to supplier.
5	transaction_mode	transaction mode	varchar(50)	not null	it will store mode of transaction online / cash
6	account_holder_name	account holder name	varchar(50)	null	it will store the name of account holder .
7	contact	contact	nchar (10)	null	It is used to store the supplier's contact number.

9.Table Name: product_details
It stores the details of the product.

Sr.no	Field Name	Expansion Name	Field Type	Null/Not Null	Description
1	f_id	fruit id	int	not null	It is a primary key and used to store the fruit id. It will auto generate.
2	f_name	fruit name	varchar(50)	not null	It is used to store the fruit name.
3	variety	variety	varchar(50)	not null	It is used to store the variety of a fruit.
4	quant	quantity	int	not null	It is used to store the total quantity of product.

THANK YOU ...
